                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequences AAF21614 - AAF22031 represent DNA sequences encoding human CC proteins AAB58711 - AAB59128. The DNA and protein sequences are associated with breast and ovarian cancer. Included in the invention are Equences AAF22032 - AAF22040 and AAB59129 which are used in the CC isolation and characterisation of the DNA and protein sequences of the CC invention. The breast and ovarian cancer associated DNA, protein, agonist or antagonist sequences exhibit cytostatic; immunosuppressive; nootropic; antiungal; antiparastic and cardiant activity. The polynucleotide and protein sequences are used in the diagnosis of cancer, particularly compressive and cardiant activity. The polynucleotide and protein sequences are used in the diagnosis of cancer, particularly compressive and ovarian cancer. The nucleic acid sequences, proteins, agonists and agonists may also be used in the diagnosis, prevention and treatment confinement disorders e.g. Addison's diabetes mellitus, Crohn's classes, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; and constitution as myocardial accidents, wound healing; and constitutions and disorders such as myocardial accidents.

Also CC included is a purified polypeptide comprising a sequence corresponding to CC are useful in diagnostics as expressed sequence tags (EST) for CC identifying expressed genes or for physical mapping of the human genome, CC in forensics, in assessing biodiversities, or in identifying mutations CC responsible for genetic disorders and other traits. The nucleotide Sequences are also useful as hybridisation probes, as oligomers for PCR, CC for chromosome and gene mapping, in the recombinant production of CC for chromosome and gene mapping, in the recombinant production of CC is useful for generating antisense DNA or RNA. The purified polypeptide is useful for generating antisense DNA or RNA. The purified polypeptide is one of the 38043 isolated cDNA/EST sequences. Note: The sequence data CC is one of the 38043 isolated cDNA/EST sequences. Note: The sequence data cobtained in electronic forms part of the printed specification, but was obtained in electronic forms part of the printed specification, but was compared to the compared of the sequence of the sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     US-09-017-715A-2_COPY_120_127 (1-8) x ADM66887 (1-488)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          is epistatic to leptin, furthermore, it refers to the obgene where an autosomal recessive trait is linked to obesity and diabetes. The present invention describes performing differential gene expression analysis between the white adipose tissue (WAT) or stromal vascular tissue (SVT) of any two different mice selected from a group consisting of wild-type, HMGI-C-/-, ob/ob, or HMGI-C-/-, ob/ob genotype mice. Accordingly, using this method novel nucleotides and the encoded proteins thereof were identified that are adipocyte specific, and as such can be used for preventing adipogenesis, diagnosing and treating diabetes, obesity, hypertension and cardiovascular disease, as well as screening for compounds that can modulate or prevent adipogenesis and treat diabetes or obesity. These compositions exhibit anorectic, antidiabetic and hypotensive activities. This polynucleotide sequence is a human homologue of a murine adipocyte specific DNA sequence of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention relates to a novel method for identifying genes that are over-expressed in adipose tissue and as such it provides targets for anti-obesity pharmaceutical compositions. Specifically, it refers to a high mobility group I-C protein (HMGI-C) that is associated with obesity and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Identifying adipocyte specific genes, useful for treating obesity or diabetes, and for identifying drug targets, by differential gene expression analysis between adipose tissue or stromal vascular tissue
                                                                                                                                                                                            Homo sapiens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAV42669 standard; cDNA; 550

It was isolated from a breast cancer cDNA library following an BST search for novel genes differentially expressed in breast cancer versus healthy breast tissue. The clone is deposited at ATCC 97175 and ATCC 97856. A gradient and stage specific BCSG1 expression has been demonstrated from virtually no detectable expression in normal or benign breast to low level and partial expression in low grade in situ breast carcinoma and high expression in infiltrating malignant breast carcinomas. BCSG1 is useful as a breast cancer progression marker. Recombinant vectors and host cells useful for recombinant production of BCSG1 polypeptides (including epitope-bearing malignant).

CC neoplastic agent. The method involves exposing cells to a chemical agent (to be tested for anti-neoplastic activity, determining a change in CC expression of at least one gene (I) of a signature gene set, where (I) CC comprises a sequence (S) selected from 8447 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in CC expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. MI can be used for screening an CC anti-neoplastic agent, and can be used for producing a product which is CC the data collected with respect to the anti-neoplastic agent as a result CC fMI, and the data is sufficient to convey the chanical structure and/or properties of the agent. MI can be used in the treatment of cancer such CC as colon, breast, stomach, lung, thyroid, ossophageal, ovarian, kidney, prostate or pancreatic cancer, adenocarcinoma, carcinoma, clear cell; cancer, infiltrating ductal cancer, infiltrating lobular cancer, squamous cell carcinoma, neuroendocrine carcinoma, papillary carcinoma and Wilm's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                28-SEP-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               US-09-017-715A-2_COPY_120_127 (1-8)
The present sequence is that of cDNA encoding the Glu-110 isoform of CDNA man gamma-synuclein. The invention relates to an isoform of gamma-CC synuclein that is caused by an A/T single nucleotide polymorphism (SNP) CC at position 329 of the gamma-synuclein coding sequence. This SNP causes a CC glutamic acid to valine change at amino acid position 110 of gamma-CC synuclein, and is associated with an increased susceptibility of cindividuals to schizophrenia spectrum disorders (SSDS). This is the first CC time that a genetic component of SSDs has been identified, and provides a CC potential target for diagnosis and treatment of schizophrenia. Gamma-CC synuclein polypeptides, especially those containing the E110V mutation, CC are used in a claimed method of screening for agonist compounds useful for the CC claimed method of screening for agonist or antagonist compounds. An CC claimed method of screening for agonist or antagonist compounds. An CC claimed method of screening for agonist or antagonist compounds. Of CC sequence is used for the discrimination of an SNP at position 329 of the CC coding sequence. Gamma-synuclein polypeptides or polynucleotides are also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Screening for compounds for treating or interfering with the onset of Schizophrenia Spectrum Disorders, by detecting interactions of candidate compounds with the gamma-synuclein polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CDS

The present sequence is that of cDNA encoding the Val-110 isoform human gamma-symuclein. The invention relates to an isoform of gamma symuclein that is caused by an A/T single nucleotide polymorphism at position 329 of the gamma-symuclein coding sequence. This SNP c glutamic acid to valine change at amino acid position 110 of gamma
                                                                                          Screening for compounds for treating or interfering with the onset of Schizophrenia Spectrum Disorders, by detecting interactions of candidate compounds with the gamma-synuclein polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  amplification of a polynucleotide encoding gamma-synuclein of the occurrence of the SNP at position 329. A transgenic for the study of SSDs is also claimed

This is the first CC time that a genetic component of SSDs has been identified, and provides a CC potential target for diagnosis and treatment of schizophrenia. Gamma-CC synuclein polypeptides, especially those containing the EllOV mutation, CC are used in a claimed method of screening for compounds useful for the CC treatment of SSDs, and gamma-synuclein expressing cells are used in a CC claimed method of screening for agonist or antagonist compounds. An CC claimed method of screening for agonist or antagonist compounds. An CC claimed method for the discrimination of the gamma-synuclein coding CC sequence is used for the discrimination of an SNP at position 329 of the CC coding sequence. Gamma-synuclein polypeptides or polynucleotides are also CC setul for the diagnosis of SSDs, or susceptibility to SSDs, e.g. by PCR CC amplification of a polynucleotide encoding gamma-synuclein and analysis CC of the occurrence of the SNP at position 329. A transgenic animal useful CC for the study of SSDs is also claimed. Note: The present sequence is not component of the specification but is derived from the gamma-synuclein components.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Local S

The invention is for treating genetic diseases such as muscular dystrophy or cystic fibrosis, and for in vitro purposes related to scientific research, synthesis of DNA and manufacture of DNA vectors. The invention is useful in gene therapy. The present sequence is human amyloid-like protein cDNA

                                                                                                                    This sequence represents the gene encoding a novel human synuclein family member designated persyn. The sequence is useful for screening, diagnosing or monitoring cancer (especially breast or skin cancer), neurodegenerative disorders or skin disorders and for identifying cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       hypertension, angina pectoris, myocardial infarction, ulcers, asthma, allergies, psychoses, depression, migraine, vomiting, benign prostatic hypertrophy or osteoporosis. The polypeptides and polynucleotides are useful for in vitro purposes related to scientific research, synthesis of DNA and manufacture of DNA vector. The present sequence represents cDNA encoding human amyloid like protein.
                                                                                                                                                                                                                                                        P-PSDB;

              The present invention relates to a new method for assessing whether a patient is afflicted with ovarian cancer. The method involves comparing the expression level of a marker in a patient sample and the normal level of expression of the marker in a control non-ovarian cancer sample, where the marker is selected from 363 cancer markers described in the specification. The method of the invention is useful in diagnosing or characterising cancer, in detecting the presence of cancer as early as possible, and the recurrence of ovarian cancer. The method may also be of particular use with patients having an enhanced risk of developing ovarian cancer (e.g. patients having a familial history of ovarian of eacher). The cancer markers may be used in the management and treatment of e.g. brain and central nervous system disorders (e.g. bacterial and viral meningitis, Alzheimer's disease or Parkinson's disease), brain and central optical management and treatment of the management cancer (e.g. brain and central optical management and treatment of the management cancer (e.g. bacterial and viral meningitis, Alzheimer's disease or Parkinson's disease), brain and central optical management and treatment of the management and the

The method comprises detecting in a target nucleic acid obtained from the subject the presence or absence of an allelic variant of one or more polymorphic regions of one or more genes selected from upa (Urokinase plasminogen activator), SNCG (gamma-synuclein), IDE (insulindegrading enzyme), KNSL1 (Kinesin-like protein 1), LIPA (lysosomal acid lypase), and TWRRSF6 (Thmour Necrosis Factor Receptor-SF6), where the presence of at least one of the allelic variant of one or more polymorphic regions is indicative of a predisposition for or the occurrence of neurodegenerative disease. The genes are all located on chromosome 10, M1 is useful for determining a predisposition for or the occurrence of, and for treating neurodegenerative disease, particularly

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention relates to a novel method of determining a predisposition for or the occurrence of neurodegenerative disease comprising detecting in a target nucleic acid obtained from the subject the presence of an allelic variant of polymorphic regions of human genes selected from urokinase plasminogen activator (uPA), gamma synuclein (SNCG), insulin degrading enzyme (IDE), kinesin-like protein 1 (KNSII), 19sosomal acid degrading enzyme (IDE), kinesin-like protein 1 (KNSII), 19sosomal acid lipase (LIPA) and tumour necrosis factor receptor SP6 (TNFRSP6). The method is useful in determining the presence or predisposition to a neurodegenerative disease, particularly Alzhahmer's disease. The present sequence is the cDNA sequence of the human SNCG gene which is related to
The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The

                                                                                                                                                                                                                                                                                                      polynuclectides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this pateent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

    No. is the number of results predicted by chance to have a
re greater than or equal to the score of the result being printed,
is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                          o a a a a a

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                          Score

It was isolated from a CC breast cancer cDNA library following an EST search for novel genes and CC differentially expressed in breast cancer versus healthy breast tissue. CC The clone is deposited at ATCC 97175 and ATCC 97856. A gradient and stage CC especific BCSG1 expression has been demonstrated from virtually no CC detectable expression in normal or benign breast to low level and partial CC expression in low grade in situ breast carcinoma and high expression in CC infiltrating malignant breast carcinomas. BCSG1 is useful as a breast CC cancer progression marker. Recombinant vectors and host cells useful for CC recombinant production of BCSG1 polypeptides (including epitope- bearing CC polypeptides) are provided. BCSG1 polypeptides (including epitope- bearing CC antibodies can be used for the detection of breast cancer cells or breast CC cancer metastasis, and to develop methods for the clinical management and CC cancer metastasis, and to develop methods for the clinical management and CC cancer metastasis, and to develop methods for the clinical management and CC cancer metastasis, and to develop methods for the clinical management and CC cancer metastasis, and to develop methods for the clinical management and CC cancer metastasis.

                                                                                                                                                                                                                                                                                                                                                                  This invention describes a novel polynucleotide (I) encoding human ADA2. The products of the invention have cytostatic activity and can be used for gene therapy. (I) is useful for treating cancer; as primers and probes for isolating full length cDNA and genes having similar biological activity. This sequence encodes a polypeptide derived from the human HBGBA67X clone which is an amyloid-like protein found in breast tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; ADA2;

```
The present invention describes a method (M1) for screening for an anti-
CC neoplastic agent. The method involves exposing cells to a chemical agent
CC to be tested for anti-neoplastic activity, determining a change in
CC expression of at least one gene (I) of a signature gene set, where (I)
CC comprises a sequence (S) selected from 8447 sequences (given in ABL61664
CC to ABL70110), or is at least 95% identical to (S), where a change in
CC expression is indicative of anti-neoplastic activity. (I) has cytostatic
CC activity and can be used in gene therapy. M1 can be used for screening an
CC anti-neoplastic agent, and can be used for producing a product which is
CC the data collected with respect to the anti-neoplastic agent as a result
CC properties of the agent. M1 can be used in the treatment of cancer such
CC properties of the agent. M1 can be used in the treatment of cancer such
CC as colon, breast, stomach, lung, thyroid, oesophageal, ovarian, kidney,
CC cancer, infiltrating ductal cancer, infiltrating lobular cancer, squamous
CC cell carcinoma, neuroendocrine carcinoma, papillary carcinoma and Wilm's
                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 1; SEQ ID NO 1680; 44pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              WPI; 2002-188264/24.

                                                                                                                                                                          The present sequence is that of cDNA encoding the Glu-110 isoform of CC human gamma-synuclein. The invention relates to an isoform of gamma-CC synuclein that is caused by an A/T single nucleotide polymorphism (SNP) CC at position 329 of the gamma-synuclein coding sequence. This SNP causes a CC glutamic acid to valine change at amino acid position 110 of gamma-CC synuclein, and is associated with an increased susceptibility of CC individuals to schizophrenia spectrum disorders (SSDs). This is the first CC time that a genetic component of SSDs has been identified, and provides a component of synuclein polypeptides, especially those containing the EllOV mutation, CC are used in a claimed method of screening for compounds useful for the treatment of SSDs, and gamma-synuclein expressing cells are used in a CC claimed method of screening for agonist or antagonist compounds. An CC claimed method of screening for agonist or antagonist compounds. An CC claimed method of screening for agonist or antagonist compounds. Of sequence is used for the discrimination of an SNP at position 329 of the CC coding sequence. Gamma-synuclein polypeptides or polynucleotides are also useful for the diagnosis of SSDs, or susceptibility to SSDs, e.g. by PCR camplification of a polynucleotide encoding gamma-synuclein and analysis of the occurrence of the SNP at position 329. A transgenic animal useful control of the StDs is also claimed

New human polypeptides and polynucleotides, useful for diagnosing or treating genetic diseases such as muscular dystrophy or cystic fibrosis, hypertension, asthma, depression or osteoporosis. Claim 18; SEQ ID NO 1; 56pp; English.

The invention relates to an isolated human polypeptide. The polypeptides, polynucleotides, agonists or antagonist are useful for diagnosing or treating genetic diseases such as muscular dystrophy or cystic fibrosis, hypertension, angina pectoris, myocardial infarction, ulcers, asthma, allergies, psychoses, depression, migraine, vomiting, benign prostatic hypertrophy or osteoporosis. The polypeptides and polynucleotides are useful for in vitro purposes related to scientific research, synthesis of DNA and manufacture of DNA vector. The present sequence represents cDNA encoding human amyloid like protein.

                                                                                     CC human gamma-synuclein. The invention relates to an isoform of gamma-
CC synuclein that is caused by an A/T single nucleotide polymorphism (SNP)
CC at position 329 of the gamma-synuclein coding sequence. This SNP causes a
CC glutamic acid to valine change at amino acid position 110 of gamma-
CC synuclein, and is associated with an increased susceptibility of
CC individuals to schizophrenia spectrum disorders (SSDs). This is the first
CC time that a genetic component of SSDs has been identified, and provides a
CC potential target for diagnosis and treatment of schizophrenia. Gamma-
CC synuclein polypeptides, especially those containing the EllOV mutation,
CC are used in a claimed method of screening for compounds useful for the
CC treatment of SSDs, and gamma-synuclein expressing cells are used in a
CC claimed method of screening for agonist or antagonist compounds. An
CC claimed method of screening for agonist or antagonist compounds
CC sequence is used for the discrimination of an SNP at position 329 of the
CC coding sequence. Gamma-synuclein polypeptides or polynucleotides are also
CC useful for the diagnosis of SSDs, or susceptibility to SSDs, e.g. by PCR
CC amplification of a polynucleotide encoding gamma-synuclein and analysis
CC of the occurrence of the SNP at position 329. A transgenic animal useful
CC shown in the specification but is derived from the gamma-synuclein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Screening for compounds for treating or interfering with the onset of Schizophrenia Spectrum Disorders, by detecting interactions of candidate compounds with the gamma-synuclein polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gamma-synuclein; human; sing
schizophrenia; neuroleptic;

The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                   CC Sequences AAF21614 - AAF22031 represent DNA sequences encoding human CC proteins AAB59718 - AAB59728. The DNA and protein sequences are CC associated with breast and ovarian cancer. Included in the invention are sequences AAF22032 - AAF22040 and AAB59129 which are used in the invention. The breast and ovarian cancer associated DNA, protein, agonist CC invention. The breast and ovarian cancer associated DNA, protein, agonist CC antigonist sequences exhibit cytostatic; immunosuppressive; nootropic; neuroprotective; antiviral; antiallergic; hepatotropic; antidiabetic; CC antiinflammatory; antilcer; vulnerary; anticonvulsant; antidiabetic; CC antiingal; antiparasitic and cardiant activity. The polynucleotide and CC protein sequences are used in the diagnosis of cancer, particularly CC breast and ovarian cancer. The nucleic acid sequences, proteins, agonists CC and agonists may also be used in the diagnosis, prevention and treatment CC immune disorders e.g. Addison's disease, allergies, autoimmune thyroiditis, diabetes mellitus, Crohn's CC disease, multiple solerosis, rheumatoid arthritis and ulcerative colitis; cardiovascular disorders such as myocardial ischaemias; wound healing; inference in a ference of inference such as cerebral anoxia and epilepsy; and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ş
                                                                        This invention relates to a novel method for identifying genes that are cover-expressed in adipose tissue and as such it provides targets for anti co-besity pharmaceutical compositions. Specifically, it refers to a high can mobility group I-C protein (HMGI-C) that is associated with obesity and can expressive trait is linked to obesity and diabetes. The present composition are expression analysis of invention describes performing differential gene expression analysis of the white adipose tissue (WAT) or strongly varied that result (WT) composition or strongly using confident mice selected from a group consisting of wild-type, composition and candiovascular specific, and as such can be used for preventing adipogenesis, diagnosing and treating diabetes obesity, these compositions exhibit anorecitic, antidiabetes or obesity. These compositions exhibit anorecitic, antidiabetes a human homologue of a murine adipocyte specific DNA sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Identifying adipocyte specific genes, useful for treating obesity or diabetes, and for identifying drug targets, by differential gene expression analysis between adipose tissue or stromal vascular tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              human; adipocyte specific; gene; ds; adipose tissue; anti-obesity; high mobility group I-C protein; HMGI-C; obesity; leptin; ob; diabetes; adipogenesis; hypertension; cardiovascular disease; anorectic; antidiabetic; hypotensive; gamma synuclein.

CC patient is afflicted with ovarian cancer. The method involves comparing CC the expression level of a marker in a patient sample and the normal level CC of expression of the marker in a control non-ovarian cancer sample, where CC the marker is selected from 363 cancer markers described in the CC specification. The method of the invention is useful in diagnosing or CC characterising cancer, in detecting the presence of cancer as early as CC possible, and the recurrence of ovarian cancer. The method may also be of CC particular use with patients having an enhanced risk of developing CC ovarian cancer (e.g. patients having a familial history of ovarian cancer). The cancer markers may be used in the management and treatment CC of e.g. brain and central nervous system disorders (e.g. bacterial and CC viral meningitis, Alzheimer's disease or Parkinson's disease), brain (CC disorders (e.g. bacterial or viral meningitis or encephalitis), CC inflammations (e.g. bacterial or viral meningitis or encephalitis), CC connective tissue disorders, or heart disorders (e.g. ischaemic heart CC disease or atherosclerosis). The compositions and methods may also be CC used in assessing the histological type of neoplasm associated with CC ovarian cancer, monitoring the progression of ovarian cancer, determining whether ovarian cancer has metastasized or is likely to metastasize.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    14-MAR-2001; 2001US-0276025P.

       The present invention relates to a method (M1) for determining a predisposition for or the occurrence of neurodegenerative disease in a subject. The method comprises detecting in a target nucleic acid obtained from the subject the presence or absence of an allelic variant of one or more polymorphic regions of one or more genes selected from upa (Urokinase plasminogen activator), SNGG (gamma-synuclein), IDE (insulindegrading enzyme), KNSL1 (Kinesin-like protein 1), LIFA (lysosomal acid lypase), and TNFRSF6 (Tumour Necrosis Factor Receptor-SF6), where the polymorphic regions is indicative of a predisposition for or the occurrence of neurodegenerative disease. The genes are all located on
                                                                                                                                                                                                                                                                                              Determining a predisposition for or the occurrence of neurodegenerative disease, e.g. Alzheimer's disease by detecting in a target nucleic acid the presence or absence of an allelic variant of one or more polymorphic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Neurodegenerative disease; uPA; SNCG; IDE; KNSL1; LIPA; TNFRSF Alzheimer's disease; neuroprotective; nootropic; gene therapy; Chromosome 10; gene; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention relates to a novel method of determining a predisposition for or the occurrence of neurodegenerative disease comprising detecting in a target nucleic acid obtained from the subject the presence of an allelic variant of polymorphic regions of human genes selected from urokinase plasminogen activator (uPA), gamma-synuclein (SNCG), insulin degrading enzyme (IDE), kinesin-like protein 1 (KNSI1), lysosomal acid lipase (LIPA) and tumour necrosis factor receptor SF6 (TNFRSF6). The method is useful in determining the presence or predisposition to a neurodegenerative disease, particularly Alzheimer's disease. The present sequence is the cDNA sequence of the human SNCG gene which is related to the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    disease,

                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated polynucleotide comprising any one o 38043 cDNA sequences, appearing as ACH12789-ACH50831, whose sequence was determined by the technique of SBH (sequencing by hybridisation). Also included is a purified polypeptide comprising a sequence corresponding to a reading frame of the novel polynucleotide. The nucleic acid sequences are useful in diagnostics as expressed sequence tags (EST) for identifying expressed genes or for physical mapping of the human genome, in forensics, in assessing biodiversities, or in identifying mutations responsible for genetic disorders and other traits. The nucleotide sequences are also useful as hybridisation probes, as oligomers for PCR,
                                                                                                                                                                                                                                                                   for chromosome and gene mapping, in the recombinant production of protein, or in generating antisense DNA or RNA. The purified polypeptide is useful for generating antibodies specific for it. The present sequence is one of the 38043 isolated cDNA/EST sequences. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at sequence.html?DocID=20030073623
